

## **PAXgene® Blood miRNA Kit Now Available to Co-purify RNA and miRNA**

**New kit allows researchers to minimize preanalytical variables for RNA and miRNA**

Advances in miRNA research have called attention the need for a standardized method for purification of small RNA species, including miRNA, from human blood samples. To address this need, PreAnalytiX GmbH, a QIAGEN/BD company, has launched the PAXgene Blood miRNA Kit.

PAXgene Blood RNA Tubes used in combination with the new PAXgene Blood miRNA Kit comprise the first system available for collecting and stabilizing whole human blood, and co-purifying total RNA enriched for miRNA. The PAXgene Blood miRNA protocol can be performed manually or automated on the QIAGEN QIAcube®. Up to 12 samples can be processed in a single run using the QIAcube variant of the PAXgene Blood miRNA protocol.
